

# Two Low Input LDOs, Three High PSRR LDOs, Two General Purpose LDOs PMIC

## FAN53870, FAN53871

### General Description

The FAN53870 family are low Iq PMICs intended for mobile power application camera modules. The PMIC contains two high power LDOs which can operate with an input as low as 1.0 V for digital cores, three LDOs which are designed to have ultra low noise and high PSRR for sensitive analog/RF circuit loads, and two other general purpose LDOs which provide excellent overall performance.

The device is available in 20-bump, 0.35 mm pitch, Wafer-Level Chip-Scale Package (WLCSP).

### Features

- LDO1 and LDO2:
  - ◆ 1 A and 1.2 A Output Current Capability Device Options
  - ◆ Programmable Output Voltage 0.8 V to 1.5 V in 8 mV Steps
  - ◆ 1.0 V to 2.0 V Input Voltage Range
  - ◆ 1.5% Accuracy
- LDO3, LDO4 and LDO5:
  - ◆ 300 mA Output Current Capability
  - ◆ Programmable Output Voltage 1.5 V to 3.4 V in 8 mV Steps
  - ◆ 1.9 V to 5.5 V Input Voltage Range
  - ◆ 14  $\mu$ V (Typ) Noise
- LDO6 and LDO7:
  - ◆ 300 mA Output Current Capability
  - ◆ Programmable Output Voltage 1.5 V to 3.4 V in 8 mV Steps
  - ◆ 1.9 V to 5.5 V Input Voltage Range
- Operation Guaranteed with Battery Voltage Down to 2.5 V
- Soft-Start function (SS) to Limit Inrush Current
- Programmable Power Start-Up/Down Sequencing
- Current Limit to Protect Against Short Circuit
- I<sup>2</sup>C Protection Fault (UVLO, OCP, UVP and OTP) Registers
- Thermal and Under Voltage Global Shutdown Protection
- I<sup>2</sup>C Serial Control to Program Output Voltage and Features
- Small Footprint: 20-Bump WLCSP, 1.61 x 1.96 mm / 0.35 mm pitch
- Pb-Free Devices

WLCSP20 1.61x1.96x0.432  
CASE 567YA

### MARKING DIAGRAM

- 12 = Alphanumeric Device Marking
- KK = Lot Run Code
- X = Alphabetical Year Code
- Y = 2-weeks Date Code
- Z = Assembly Plant Code

### ORDERING INFORMATION

See detailed ordering and shipping information on page 3 of this data sheet.

### Applications

- Smart Phones
- Wearables
- Smart Watch
- Health Monitoring
- Sensor Drive
- Energy Harvesting
- Utility and Safety Modules
- RF Modules

## PIN DEFINITIONS

| Pin | Pin Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A1  | VIN6         | Input power pin for LDO6. Place $C_{VIN6}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                                     |
| A2  | VIN7         | Input power pin for LDO7. Place $C_{VIN7}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                                     |
| A3  | LDO7         | This is the output pin for LDO7. Place $C_{LDO7}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |
| A4  | LDO2         | This is the output pin for LDO2. Place $C_{LDO2}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |
| A5  | VIN12        | Input power pin for LDO1 and LDO2. Place $C_{VIN12}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                           |
| B1  | LDO6         | This is the output pin for LDO6. Place $C_{LDO6}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |
| B2  | INT<br>INT_B | Fault interrupt pin is a push-pull, active high configuration and pulls high to indicate an interrupt event has occurred. This pin returns to low when all I <sup>2</sup> C interrupt bits are equal to 0.<br>Fault interrupt pin is an open-drain configuration and pulls low to indicate an interrupt event has occurred. This pin returns to Hi-Z when all I <sup>2</sup> C interrupt bits equal 0. An external pull-up resistor is required. |
| B3  | SDA          | I <sup>2</sup> C Data pin. Node should be tied high through a pull up resistor.                                                                                                                                                                                                                                                                                                                                                                  |
| B4  | SCL          | I <sup>2</sup> C Clock pin. Node should be tied high through a pull up resistor.                                                                                                                                                                                                                                                                                                                                                                 |
| B5  | LDO1         | This is the output pin for LDO1. Place $C_{LDO1}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |
| C1  | LDO4         | This is the output pin for LDO4. Place $C_{LDO4}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |
| C2  | AGND         | Digital/Analog ground connection. Tie to analog ground plane.                                                                                                                                                                                                                                                                                                                                                                                    |
| C3  | AGND         | Digital/Analog ground connection. Tie to analog ground plane.                                                                                                                                                                                                                                                                                                                                                                                    |
| C4  | RESET_B      | RESET_B pin is used to enable basic circuits necessary for controlling the PMIC. The RESET_B pin has an internal 4 M $\Omega$ (typ) pull-down and should not be left floating. When RESET_B pin is low, I <sup>2</sup> C is not accessible.                                                                                                                                                                                                      |
| C5  | VREF         | Reference bypass pin. If used, connect a 100 nF capacitor between this pin and analog ground.                                                                                                                                                                                                                                                                                                                                                    |
| D1  | LDO3         | This is the output pin for LDO3. Place $C_{LDO3}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |
| D2  | VIN34        | This is the input power pin for LDO3 and LDO4. Place $C_{VIN34}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                               |
| D3  | VSYS         | System power pin. Route trace from system to this pin. Connect the $C_{SYS}$ capacitor as close to this pin as possible.                                                                                                                                                                                                                                                                                                                         |
| D4  | VIN5         | Input power pin for LDO5. Place $C_{VIN5}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                                     |
| D5  | LDO5         | This is the output pin for LDO5. Place $C_{LDO5}$ as close to this pin as possible.                                                                                                                                                                                                                                                                                                                                                              |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

**THERMAL CHARACTERISTICS** (Junction-to-ambient thermal resistance is a function of application and board layout. This data is measured with two-layer 2s2p boards with vias in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature T<sub>J(max)</sub> at a given ambient temperature T<sub>A</sub>.)

| Symbol          | Characteristic                          | Conditions | Min | Typ  | Max | Unit |

## FUNCTIONAL SPECIFICATIONS

**Device Operation***Overview*

The FAN53870 micro Power Management IC(PMIC) is optimized to supply different sub systems of battery powered mobile applications. It integrates seven low-dropout regulators: two high current LDOs, three ultra low noise / high PSRR LDOs, two general purpose LDOs.

The features of the FAN53870 can be programmed through an I<sup>2</sup>C interface.

*Under Voltage Lockout (UVLO)*

When enabling, if VSYS is above Power-On Reset (POR) voltage but below its UVLO rising threshold, or if VINs of the LDOs are below their UVLO rising threshold, the assigned UVLO interrupt bit and UVLO status bit will be set, and the Interrupt pin asserted. The UVLO status bit remains set as long as the input voltage is below its UVLO rising threshold.

When VSYS or VINs fall below their UVLO falling threshold, the LDO(s) will shut down, an UVLO interrupt will be declared. The UVLO status bit remains set until the input voltage rises above its UVLO rising threshold, and the LDO(s) performs startup immediately.

The suspend bits will be set upon shutdown. The LDO(s) will stay in shutdown for a minimum of 20 ms and then attempt a restart if VSYS or VINs have risen above their UVLO rising threshold. The suspend bits are cleared upon restart. The LDO(s) will be disabled permanently after the 4th UVLO fault.

*Thermal Management*

When the die temperature rises to a nominal 125°C, the thermal Warning status bit will be set to “1” and remain set until the die temperature drops to a nominal 110°C.

If the die temperature continues to rise to a nominal 140°C, a Thermal Shutdown event is activated, all the LDOs are disabled, the Thermal Shutdown interrupt bit is set but I<sup>2</sup>C communication remains. The Thermal Shutdown status bit is also set and will remain set as long as the device is above the Thermal Warning temperature. The chip suspend bit is set upon shutdown.

After the die temperature falls below the Thermal Warning threshold, the Thermal Shutdown status and chip suspend bits will be cleared, and the device will return to the operating conditions prior to the thermal shutdown event.

*Enabling / Disabling*

The FAN53870 LDOs can be enabled and disabled independently with the LDOx\_EN bits in the ENABLE register.

To enable FAN53870 LDOs, with RESET\_B pin high, set the LDOx\_EN bits to “1”. The FAN53870 LDOs have internal soft-start, which limits the inrush current to the ILIM setting. The LDOs will ignore faults during the first 1.5 ms at startup. After 1.5 ms, if the LDO output fails to

reach the UVP rising threshold, an UVP fault will be declared.

To disable the FAN53870 LDOs, set the LDOx\_EN bits to “0”. The active discharge feature is enabled by default, with which, an 100 Ω resistor is connected between VOUT and GND to discharge the output capacitors when the LDOx\_en bits are set to “0”.

To do a global shutdown of all LDOs, set RESET\_B pin low.

*Over-current Protection (OCP)*

The LDOs are protected from excessive load and short-circuit. The current limit level can be programmed through the I<sup>2</sup>C interface.

When an over-load event occurs, the current is automatically limited to the programmed current limit. And once the current limit is detected, the associated OCP status bit is set, and if the LDO remains in current limit for more than 1 ms, the OCP interrupt bit will be set, and the Interrupt pin asserted. Then the LDO will shut down permanently without attempting any restart, meanwhile the associated suspend bit is set and status bit is cleared.

The OCP debounce timer is programmable through I<sup>2</sup>C. Hiccup mode option is also available for OCP, which can be accommodated by contacting an **onsemi** representative.

*Under Voltage Protection (UVP)*

If the output voltage falls approximately 20% (10% for LDO1/2) below the target VOUT, the associated UVP status bit will be set. If the fault persists for more than 50 μs, the UVP interrupt bit will be set, and the Interrupt pin asserted. The LDO will then be disabled, the associated status bit is cleared and the suspend bit is set. The interrupt bit will be cleared upon a read of the bit.

The LDO will attempt a restart in 20 ms and the suspend bit will be reset to “0” upon restart. And after the 4th UVP fault, the LDO shuts down permanently.

*4-Fault Shutdown*

To prevent repetitive starting and faulting of an LDO or of the IC itself, detection of 4 failures will result in a permanent shutdown of the LDO, or if it is a system fault, the entire IC will shut down permanently.

Individual LDO Fault: the LDO will be latched-off after the 4th individual LDO fault (any combination of UVP, and/or OCP, and/or VINx UVLO), and the LDOx\_EN bit will be cleared. In order to clear the latch-off and re-enable the LDOs, set the LDOx\_EN bits to “1”.

Chip Fault: all the LDOs will be latched-off after the 4th chip fault (any combination of Thermal Shutdown, and/or VSYS UVLO) with all the LDOx\_EN bits cleared. In order to clear the latch-off, RESET\_B pin needs to be pulled low.

## Reset

When the RESET\_B pin is pulled LOW, the INTERRUPTx and STATUSx bits will be cleared. All the other registers will remain set to their programmed values, but I<sup>2</sup>C communication with the device is disabled. Additionally, all internal fault counters will reset to 0.

When the RESET\_B pin is pulled HIGH, the I<sup>2</sup>C block is turned on. The Reset\_B pin should not be asserted high while there is data transmission on the I<sup>2</sup>C bus. This will ensure the FAN53870 doesn't mis-interpret a logic low on SDA as a falling edge and inadvertently create a "Start" condition, and unintended data written to the FAN53870 registers. It is recommended that the FAN53870 is enabled when there is a brief break in I<sup>2</sup>C data transmissions.

The SOFT\_RESET bits in the RESET register can be used to clear all registers to their default values.

## Power Up/Down Sequence

Power up and power down sequence can be programmed and controlled with the dedicated registers xxxx\_SEQ and SEQUENCING.

If an LDO faults during a start-up sequence, the other LDOs will still be starting up in their assigned time slot. The xxxx\_SEQ register bits for the faulted LDO will remain set to the previously values. The system can then attempt to start the faulted LDO in another sequence by setting the SEQ\_CONTROL bits to "01" or by clearing the xxxx\_SEQ bits to "000" and writing a "1" to the enable bit for the faulted LDO.

## No Fault Shutdown

FAN53870 provides a "No Fault Shutdown" feature, which prevents LDOs from shutting down during an OCP or UVP event. It is activated by setting the FLT\_SD\_B bit in RESET register to "1".

By setting FLT\_SD\_B to "1", it prevents the shutdown during an OCP or UVP event, but not during LDO VIN UVLO event. With FLT\_SD\_B=1, when LDO VIN UVLO, OCP or OVP event occurs, the interrupt and status bits will still indicate the fault has occurred, but the fault counter will not be incremented.

## I<sup>2</sup>C Functionality

### I<sup>2</sup>C Interface

The FAN53870 serial interface is compatible with Standard, Fast and Fast Plus Mode I<sup>2</sup>C Bus specifications. The SCL line is an input and its SDA line is a bi-directional open-drain output; it can only pull down the bus when active. The SDA line only pulls LOW during data reads and when signaling ACK. All data is shifted in MSB (bit 7) first.

Please refer to the *Reset* section for guidance on RESET\_B LOW to HIGH pin timing for proper enabling of the I<sup>2</sup>C block.

## I<sup>2</sup>C Slave Address

The default I<sup>2</sup>C slave address is shown in Table 3. The LSB of the address byte is used as the read/write bit and is not included in the 7 bit Hex, Decimal or Binary value as shown in Table 3. Table 4 is an example (using the FAN53870) to show the location of the R/W bit.

The I<sup>2</sup>C address can also be changed by setting in the I2C\_ADDR\_SEL register.

Other default slave addresses can be accommodated by contacting an **onsemi** representative.

**Table 3. I<sup>2</sup>C SLAVE ADDRESS**

| Device   | Hex   | Decimal | 7 bit Binary |
|----------|-------|---------|--------------|
| FAN53870 | 7'h35 | 53d     | 011 0101     |
| FAN53871 | 7'h20 | 32d     | 010 0000     |

**Table 4. I<sup>2</sup>C (7 bit) SLAVE ADDRESS BYTE**

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
|---|---|---|---|---|---|---|-----|
| 0 | 1 | 1 | 0 | 1 | 0 | 1 | R/W |

## Bus Timing

As shown in Figure 25, data is normally transferred when SCL is LOW. Data is clocked in on the rising edge of SCL. Typically, data transitions shortly at or after the falling edge of SCL to allow ample time for the data to set up before the next SCL rising edge.

**Figure 25. Data Transfer Timing**

Each bus transaction begins and ends with SDA and SCL HIGH. A transaction begins with a START condition, which is defined as SDA transitioning from 1 to 0 with SCL HIGH, as shown in Figure 26.

**Figure 26. Start Bit**

Transactions end with a STOP condition, which is SDA transitioning from 0 to 1 with SCL HIGH, as shown in Figure 27.

Figure 27. Stop Bit

During a read from the FAN53870, the master issues a Repeated Start after sending the register address and before resending the slave address. The Repeated Start is a 1-to-0 transition on SDA while SCL is HIGH, as shown in Figure 28.

Figure 28. Repeated Start Timing

### Read and Write Transactions

The figures below outline the sequences for data read and write. Bus control is signified by the shading of the packet, defined as **Master Drives Bus** and **Slave Drives Bus**. All addresses and data are MSB first.

### Multi-Byte (Sequential) Read and Write Transactions

#### Sequential Write (Figure 31)

The Slave Address, Reg Addr address, and the first data byte are transmitted to the FAN53870 in the same way as in a single-byte write (Figure 29). However, instead of generating a Stop condition, the master transmits additional bytes that are written to consecutive sequential registers after the falling edge of the eighth bit. After the last byte written and its ACK bit received, the master issues a STOP bit. The IC contains an 8-bit counter that increments the address pointer after each byte is written.

#### Sequential Read (Figure 32)

Sequential reads are initiated in the same way as a single-byte read (Figure 30), except that once the slave transmits the first data byte, the master issues an acknowledge instead of a STOP condition. This directs the slave's I<sup>2</sup>C logic to transmit the next sequentially addressed 8-bit word. The FAN53870 contains an 8-bit counter that increments the address pointer after each byte is read, which allows the entire memory contents to be read during one I<sup>2</sup>C transaction.

## APPLICATION GUIDELINES

**LDO Input Capacitor Considerations**

If long wires are used to bring power to an evaluation board, additional “bulk” capacitance (electrolytic or tantalum) should be placed (on the evaluation board) between  $C_{IN}$  and the power source lead to reduce ringing that can occur between the inductance of the power source leads and  $C_{IN}$ . Use only X5R and X7R ceramic capacitors with adequate voltage rating for the input capacitors.

The effective capacitance value decreases as the voltage across the capacitor increases due to DC bias effects. Adding additional capacitance to the minimum recommended ensures reliable operation.

**LDO Output Capacitor Considerations**

FAN53870 LDOs are initially set at the factory for a range of 5.5 to 17  $\mu$ F (unbiased) on LDO1 and LDO2, and a range of 1.0 to 4.7  $\mu$ F (unbiased) on LDO3–7. All LDOs can be trimmed at the factory for up to 47  $\mu$ F total (unbiased) capacitance. When evaluating and ordering the FAN53870,

to ensure optimum performance and stability, specify the amount of capacitance each LDO output will have with an **onsemi** representative.

Use only X5R and X7R ceramic capacitors with adequate voltage rating for the output capacitors.

**PCB Layout Recommendations**

Input and output capacitors should be placed as close to the associated power pin. The ground terminal of the capacitor should be connected to a good ground plane – preferably on the surface of the board. Input power should be routed to the input capacitor first and then to the input pin of the IC. For power from layers other than the layer on which the capacitor sits, should be routed to the capacitor layer with vias in pad or close to the positive terminal of the capacitor. Power traces from the LDO output should be routed to the output capacitor first and then to (if necessary) other layers.
