

500-W, Wide-Mains, NCP1655A-driven Evaluation Board User's Manual

EVBUM2865/D

INTRODUCTION

The NCP1655A is an innovative multimode power factor controller [1]. The circuit naturally transitions from one operation mode (CCM, CrM or DCM) to another depending on the switching period duration so that the efficiency is optimized over the line/load range. In very light-load conditions, the circuit enters the soft-SKIP mode for minimized losses. Housed in a SO-9 package, the circuit further incorporates the features necessary for building robust and compact PFC stages, with few external components.

The evaluation board is a 500-W wide-mains PFC stage.

EVB ELECTRICAL SPECIFICATIONS

Description	Value	Unit
Input Voltage Range	90–265	V rms
Line Frequency Range	45 to 66	Hz
Maximum Output Power	500	W
Nominal Output Voltage	388	V
Minimum Output Load Current	0	mA
Maximum Output Load Current	1300	mA
Load Conditions For Efficiency Measurements (10%, 20%,...)	10–100	%
Minimum Efficiency Over Above Load Range, 115 V rms	95	%
Minimum PF Over The Line Range At Full Load	95	%
Hold-Up Time (the output voltage remaining above 300 V)	> 10	ms
Peak-To-Peak Low Frequency Output Ripple	< 8	%
Voltage Source for NCP1655A Supply (*)	11.5 to 18.0	V

*As shown by Figure 3, the 18-V maximum value is due to the Zener diode (D_{Z4}) which is implemented in the board to protect it from the excessive voltages which could be applied to the V_{CC} socket. However, the NCP1655A V_{CC} pin can receive a voltage as high as 35 V.

The board contains high-voltage and hot, live parts. It must not be handled except by experienced professionals.

Be very cautious when manipulating or testing it. It embeds no circuitry to discharge the X2 capacitors of the EMI filter. Also note that the EVB delivers a voltage in the range of 400 V ($V_{out} = 388$ V nominally), leading to the risk of a severe electric chock, if improperly handled. Get sure that the output capacitor is properly discharged before manipulating the board.

It is the responsibility of the board users, to take all the precautions to avoid electric hazards and any other pains.

Figure 1. The Wide-mains, 500-W PFC Stage

[illegible]

Figure 2 shows the power section of the application schematic. A SOT23-5 driver (FAN3100T from **onsemi** [2]) is used to drive one single FCPF067N65 MOSFETS ($Q1a$) [3]. Note however that as shown in the annex, the board supports the implementation of two MOSFETs in parallel ($Q1a$ and $Q1b$), which can provide a further improved efficiency. Silicon Carbide Schottky diode (SiC) FFSPF0865A from **onsemi** is used as the boost diode [4]. An

NTC is placed in series with the bulk capacitor C_4 to limit inrush currents when the PFC stage is plugged in. MOSFET Q_2 (FCA76N60 – 600-V, 36-m Ω , TO-3P MOSFET from **onsemi** [5]) is implemented to bypass the NTC when the bulk capacitor is charged. Practically, the drive voltage and the output of charge pump (R_1 , C_{11} , D_{Z1} , D_7) are applied to the Q_2 gate so that Q_2 is on and the NTC bypassed as soon as the PFC stage is in operation.

Control Section

Figure 3. Control Section of the Application Schematic

An external power source is to be applied to the board (using socket *J11*) to power the NCP1655A. Apply 12 V or more to ensure that the circuit has enough voltage to startup. Note however that due to the protecting Zener diode (*DZ4*) implemented in the board, the power source voltage should not exceed 18 V.

IMPORTANT REMARK:

Proposed circuitry is only intended to illustrate the NCP1655 operation. It should not be re-used in practical applications as is unless appropriate verifications are made to check that it can meet reliability and safety requirements and comply with relevant norms.

In particular, no circuitry to discharge the X2 capacitors of the EMI filter is implemented in the evaluation board. Also, the inrush management circuitry may not be re-used if risks exist that the NTC is not properly shorted when the PFC stage starts switching. If the NTC is not shorted, the V_{OUT} voltage will be the sum of the bulk capacitor voltage plus the voltage produced by the inductor current across the NTC ($V_{C4} + (R_{NTC} \times I_L)$) and in this case, too high a ($R_{NTC} \times I_L$) voltage can be destructive for the application. It must be also noted that the inrush management circuitry increases the current loop when the boost stage fuels the bulk capacitor, making the layout less optimal for very high-speed switching operation, particularly with high t_{RR} boost diodes.

TYPICAL WAVEFORMS

Figure 4 shows the line current at 115 V rms and at below different load levels:

- At full load, the NCP1655 operates in CCM.
- At 50% of the load, the system operates in critical conduction mode
- At 40% of the load, the circuit operates in critical conduction mode with a 125-kHz clamp (frequency-clamped critical conduction mode – FCCrM) leading to valley 2 operation near the line zero crossing as illustrated by Figure 5.

- At 20% load, the NCP1655 frequency foldback makes the PFC stage operate at nearly 30 kHz. Note that the circuit continues turning on at the valley and that the number of valleys depends on the line instantaneous voltage. For instance, the number of skipped valleys is high at the top of the sinusoid where the resonant period is short while turn on in the second valley is obtained at the line zero crossing where the resonant period is long. See Figure 6. However, the NCP1655 always turns on at the valley as long as valleys are detectable.

Figure 4. Line Current at 115 V rms

Figure 5. Operation at 115 V rms, 40% Load

Figure 6. Low Frequency Operation at 115 V rms, 20% Load

CCM OPERATION

The transition point is measured by increasing /decreasing the load by 1-mA steps.

Table 1.

Line rms Voltage	Load Current for Exiting CCM	Load Current for Entering CCM
90 V	524 mA	610 mA
115 V	779 mA	893 mA
150 V	1034 mA	1205 mA
180 V	1133 mA	1460 mA
230 V	888 mA	1021 mA
265 V	798 mA	922 mA

BOARD PERFORMANCE

Efficiency

The efficiency is measured on an automated bench at 90 V rms, 115 V rms, 230 V rms and 265 V rms. For each of these four line levels, measurements start with a full-load

30-mn warm-up, after which the load is decreased from 1.30 A down to 0.13 A by 0.13-A steps. The measure is made after 5 mn at the operating point under test.

Figure 7. Efficiency versus Load

The efficiency remains above 93% from 10% to 100% of the load at the 4 tested line levels (90 V rms, 115 V rms, 230 V rms and 265 V rms).

Power Factor and THD

Power factor and THD are measured over the load range. Practically, the load current is swept starting from 1300 mA to 130 mA with 130-mA steps.

a) Power Factor (PF)

b) Total Harmonic Distortion (THD)

onsemi, **onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.

The evaluation board/kit (research and development board/kit) (hereinafter the "board") is not a finished product and is not available for sale to consumers. The board is only intended for research, development, demonstration and evaluation purposes and will only be used in laboratory/development areas by persons with an engineering/technical training and familiar with the risks associated with handling electrical/mechanical components, systems and subsystems. This person assumes full responsibility/liability for proper and safe handling. Any other use, resale or redistribution for any other purpose is strictly prohibited.

THE BOARD IS PROVIDED BY ONSEMI TO YOU "AS IS" AND WITHOUT ANY REPRESENTATIONS OR WARRANTIES WHATSOEVER. WITHOUT LIMITING THE FOREGOING, ONSEMI (AND ITS LICENSORS/SUPPLIERS) HEREBY DISCLAIMS ANY AND ALL REPRESENTATIONS AND WARRANTIES IN RELATION TO THE BOARD, ANY MODIFICATIONS, OR THIS AGREEMENT, WHETHER EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING WITHOUT LIMITATION ANY AND ALL REPRESENTATIONS AND WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, AND THOSE ARISING FROM A COURSE OF DEALING, TRADE USAGE, TRADE CUSTOM OR TRADE PRACTICE.

onsemi reserves the right to make changes without further notice to any board.

You are responsible for determining whether the board will be suitable for your intended use or application or will achieve your intended results. Prior to using or distributing any systems that have been evaluated, designed or tested using the board, you agree to test and validate your design to confirm the functionality for your application. Any technical, applications or design information or advice, quality characterization, reliability data or other services provided by **onsemi** shall not constitute any representation or warranty by **onsemi**, and no additional obligations or liabilities shall arise from **onsemi** having provided such information or services.

onsemi products including the boards are not designed, intended, or authorized for use in life support systems, or any FDA Class 3 medical devices or medical devices with a similar or equivalent classification in a foreign jurisdiction, or any devices intended for implantation in the human body. You agree to indemnify, defend and hold harmless **onsemi**, its directors, officers, employees, representatives, agents, subsidiaries, affiliates, distributors, and assigns, against any and all liabilities, losses, costs, damages, judgments, and expenses, arising out of any claim, demand, investigation, lawsuit, regulatory action or cause of action arising out of or associated with any unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of any products and/or the board.

This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and may not meet the technical requirements of these or other related directives.

FCC WARNING – This evaluation board/kit is intended for use for engineering development, demonstration, or evaluation purposes only and is not considered by **onsemi** to be a finished end product fit for general consumer use. It may generate, use, or radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment may cause interference with radio communications, in which case the user shall be responsible, at its expense, to take whatever measures may be required to correct this interference.

onsemi does not convey any license under its patent rights nor the rights of others.

LIMITATIONS OF LIABILITY: **onsemi** shall not be liable for any special, consequential, incidental, indirect or punitive damages, including, but not limited to the costs of requalification, delay, loss of profits or goodwill, arising out of or in connection with the board, even if **onsemi** is advised of the possibility of such damages. In no event shall **onsemi**'s aggregate liability from any obligation arising out of or in connection with the board, under any theory of liability, exceed the purchase price paid for the board, if any.

The board is provided to you subject to the license and other terms per **onsemi**'s standard terms and conditions of sale. For more information and documentation, please visit www.onsemi.com.
